# TRADING PARTNER LABELS IMPLEMENTATION GUIDELINES 

USING LINEAR AND 2D SYMBOLOGIES
(Combined AIAG B10, B12, and B14)

# Trading Partner Labels Using Linear and 2D Symbols 

AIAG PUBLICATIONS
An AIAG publication reflects a consensus of those substantially concerned with its scope and provisions. An AIAG publication is intended as a guide to aid the manufacturer, the consumer and the general public. The existence of an AIAG publication does not in any respect preclude anyone from manufacturing, marketing, purchasing, or using products, processes, or procedures not conforming to the publication.

## CAUTIONARY NOTICE

AIAG publications are subject to periodic review and users are cautioned to obtain the latest editions.

## MAINTENANCE PROCEDURE

Recognizing that this AIAG publication may not cover all circumstances, AIAG has established a maintenance procedure. Please refer to the Maintenance Request Form at the back of this document to submit a request.

## APPROVAL STATUS

The AIAG Materials Management Steering Committee and designated stakeholders approved this document for publication on June 3, 2004.

## Trading Partner Labels Using Linear and 2D Symbols

## FOREWORD

This guideline has been published to combine the B10 Trading Partner Labels Implementation Guideline, the B-12 Quick Receive Guideline, and the B14 Guideline for Use of Two Dimensional Symbols with AIAG Trading Partner Labels into one cohesive document. The wealth of data required on today's shipping labels, updates to the referenced documents, and the need to review them all in building an effective shipping label necessitated this integration.

This document is presented as a guideline to design and implement trading partner labels.
As a reference;

- The B-10 outlined the requirements for printing labels for Unit Loads and Transport Packages to ensure the scannability of bar code symbols and to provide label format consistency.
- The B-12 supplied information on the Quick Receive function.
- The B-14 provided guidelines on when using 2D is appropriate, which symbology(s) to use, recommended data formats, and printing and scanning recommendations.

## INTRODUCTION

The purpose of a Trading Partner label is to facilitate the movement of goods and the exchange of data among all members within a channel of distribution (suppliers, carriers, customers, and others). The amount of data (bar code, 2D symbol, and human readable text) needed on a label is a function of the needs of the trading partners involved.

# Trading Partner Labels Using Linear and 2D Symbols 

### 1.0 DEFINITIONS

See the AIAG-maintained "Definitions" under AIAG AIDC Glossary link at the URL http://www2.aiag.org/committees/AIAGAIDCGlossary.pdf that applies to this document.

### 2.0 NORMATIVE REFERENCES

The following national, international, and industry standards and guidelines are referenced in this document.

AIAG B-8 Quality Assurance Guideline for Shipping Labels
ANS MH10.8.1 Linear bar code and two-dimensional symbols used in shipping, receiving, and transport applications

ANS MH10.8.2 Data Application Identifiers
ANS MH10.8.3 Syntax for high capacity ADC media
ANS X12 A collection of all ANSI-approved X12 standards (Note: Unit of Measure codes are found in the Data Element 355 section.)

DUNS® ${ }^{\circledR} \quad$ Number Users Guide

MIL-L-61002 Labels, pressure-sensitive adhesive, for bar codes and other markings

# Trading Partner Labels Using Linear and 2D Symbols 

### 3.0 LABEL CONCEPT

When a Trading Partner label is used in conjunction with computerized databases and electronic data interchange (EDI), the amount of data needed on a label may be reduced significantly.

### 3.1 Symbologies

Two linear symbologies, Code 39 or Code 128, with ANS MH10.8.2 Data Identifiers (DIs), have been selected to implement the label format.

The use of the two-dimensional (2D) symbols, PDF 417 and MaxiCode, on Trading Partner labels is also approved and discussed as to their usage in this guideline.

### 3.2 Labeler

For the purposes of this document, the term labeler SHALL refer to the organization responsible for having the label, or a section of the label, printed and applied.

### 3.3 Segments

Segments are logical groupings of information based on the data needs of the trading partners within the distribution channel. These segments are defined as:

CARRIER
CUSTOMER
SUPPLIER

### 3.4 Information Exchange Considerations

Trading partners and members within a channel of distribution (suppliers, carriers, customers, and others) may have different information needs. Some required information may be common among two or more trading partners, while other information may be specific to a single trading partner.

Because information is generally known at different times, the label concept provides for logical groupings of information based on this timing. These logical groupings of information are called segments. Examples of information that may be included on unit loads or transport container labels are shown in Figure 1.

## Trading Partner Labels Using Linear and 2D Symbols

### 3.5 Label Data Content

Control of the data that appear in each segment and the layout of that data is the responsibility of the owner of that segment (i.e., Supplier Segment by the supplier, Customer Segment by the customer, Carrier Segment by the carrier) unless otherwise identified in this guideline.

This label concept provides flexibility by not mandating specific data to be included in any segment except as noted in the Label Data Content section of this document. Appendix D of this standard provides a recommended order of data.

# Trading Partner Labels Using Linear and 2D Symbols 

Figure 1. Label Segments and Typical Data

### 4.0 LINEAR SYMBOLOGY SPECIFICATIONS

When a linear symbology is used on a Trading Partner Label, either Code 39 as described in ISO/IEC 16388 Bar Code Symbology Specification - Code 39 or Code 128 as described in ISO/IEC 15417 Bar Code Symbology Specification - Code 128 SHALL be used.

When Code 39 is used, it SHALL NOT use the full ASCII option.
When Code 128 is used, the symbol SHALL NOT be a UCC EAN Code 128 symbol.
See Section 13 for 2D Symbology Specifications.

### 4.1 Bar Code Height

The minimum bar height for both linear symbologies SHALL be 0.5 inch ( 13 mm ).

### 4.2 Narrow Element "X" Dimension

The narrowest bar and space in a linear bar code symbol is called the narrow element and is used to define the " X "-, or width-, dimension of that bar code.

### 4.2.1 Code 39

The significant parameters of each Code 39 symbol are the average width of the narrow elements (bars and spaces) and the average ratio of narrow elements to wide elements.

For each Code 39 symbol, the average width of the narrow elements SHALL be within the range of 0.010 inch $(0.25 \mathrm{~mm})$ to 0.017 inch $(0.43 \mathrm{~mm})$, as determined by the printing capability of the supplier/printer of the label.

The ratio of the wide elements to the narrow elements SHOULD be 3:1. The measured ratio SHALL be between 2.8:1 and 3.2:1.

### 4.2.2 Code 128

Each Code 128 data character consists of a 1X, 2X, 3X and 4X width element.
For each Code 128 symbol, the average width of the 1X narrow element SHALL be within the range of 0.010 inch ( 0.25 ) to 0.017 inch $(0.43 \mathrm{~mm})$.

### 4.2.3 The narrow element " $X$ " dimension -

SHOULD be consistent for all linear bar code symbols contained on the label.

## Trading Partner Labels Using Linear and 2D Symbols

Certain scanning applications require consistent " X " dimensions from one symbol to the next. Printing individual bar codes with different " X " dimensions on the same label may cause scanning problems.

NOTE: Symbols with narrow elements below 0.013 inch $(0.33 \mathrm{~mm})$ may require special care to meet bar code print quality and scanning requirements.

### 4.3 Quiet Zones for Code 39 and Code 128

In order to function properly, bar code-reading equipment must have totally clear areas at both ends of the symbol with no printing or graphics. These clear areas are called quiet zones. See Figure 2.

### 4.3.1 Code 39

Each of the leading and trailing quiet zones for a Code 39 symbol SHOULD be 0.25 inch ( 6.4 mm ) and SHALL be a minimum of 10 times the width of the narrow element.

### 4.3.2 Code 128

Each of the leading and trailing quiet zones for a Code 128 symbol SHALL be a minimum of 10 times the width of the narrowest element or 0.25 inches ( 6.4 mm ), whichever is greater.

Figure 2. Quiet Zone Dimension

Note: Bar Code in this example is Code 128.

## Trading Partner Labels Using Linear and 2D Symbols

### 4.4 Check Digits for Code 39 and Code 128

A Check Digit is a digit or character calculated from other characters in a code by means of a defined algorithm and used to check that the code is correctly composed.

### 4.4.1 Code 39

Check digits SHALL NOT be used in Code 39 symbols.

### 4.4.2 Code 128

The Code 128 symbology includes a mandatory check digit as the last character before the stop character. The check digit SHALL NOT be shown in the human readable interpretation.

### 4.5 Quality for Code 39 and Code 128

Code 39 and Code 128 symbols must be readable throughout the system of use. For this reason quality tests SHOULD be performed from label production through end use.

### 4.5.1 Code 39 and Code 128 Print Quality

The ISO/IEC 15416 Bar Code Print Quality Test Specification - Linear Symbols SHALL be used to determine Code 39 and Code 128 symbol print quality. Unless otherwise specified by trading partners, the minimum symbol grade SHALL be 2.0/05/660 where:

- $\quad$ Minimum print quality grade $=2.0$ (C)
- Measurement aperture $=0.005$ inch $(0.127 \mathrm{~mm})$
- Inspection wavelength $=660$ nanometers $\pm 10$ nanometers.

The above symbol quality and measurement parameters ensure scannability over a broad range of scanning environments.

- NOTE: Previous AIAG standards specified an inspection wavelength of 900 nanometers to accommodate existing infrared scanners. In most cases, compliance at 900 nanometers is an indicator of compliance at 660 nanometers. When discrepancies occur, measurements SHALL be made at 660 nanometers.

### 4.6 Human Readable Interpretation (HRI)

The data encoded in the bar code symbol SHALL be represented in human readable characters above the bar code symbol. See Figures 3 and 7 for examples of Human Readable Interpretation (HRI).

# Trading Partner Labels Using Linear and 2D Symbols 

Data Identifiers (DIs) and symbology start and stop characters SHALL NOT be printed in the humanreadable interpretation. ANSI MH10.8.2 Data Identifiers and Code 39 symbology start and stop characters are not considered part of the data.

The Data Identifier (DI) is to be shown in parentheses near the title. See Figures 3 and 7.

The human-readable interpretation SHALL be upper case characters. Sans serif fonts (such as Arial or Helvetica) are preferred. A font that clearly differentiates the letter O from the number 0 (as with a dot or line in the number 0) SHOULD be used.

The human-readable interpretation SHALL be printed left justified approximately 1.0 to 1.5 inch ( 25 to 38 mm ) from the left edge of the building block or sub-block. The HRI is indented to leave room for the title. See Figure 3.

The human readable interpretation of the data encoded in the bar code symbol SHALL be printed at either 2 or 3 LPB. The chosen LPB of the HRI SHOULD NOT interfere with the height of the bar code symbol. See Figure 6.

### 4.7 Side-by-Side Bar Code Block

Previous AIAG label standards have permitted two bar code symbols side by side. The ANSI MH10.8 standard cautions that care SHOULD be taken, but it provides no explicit guidance for printing side-byside bar codes. This guideline for using side-by-side bar codes provides that guidance.

Figure 3. Example of Side-by-Side Bar Codes

NOT TO SCALE

Note: Bar Code in this example is Code 128.
If a second bar code sub-block is required within a single building block, the following rules SHALL apply (see Figure 4, and Section 5.1):

- Quiet zones, bar code height, and other bar code specifications must still be maintained.
- There SHALL NOT be more than two bar code sub-blocks in any single building block.

## Trading Partner Labels Using Linear and 2D Symbols

- The first bar code sub-block SHALL be the left-most sub-block within the building block.
- The second bar code sub-block SHALL be the right-most sub-block within the building block.
- The vertical line separating the sub-blocks MAY be omitted between two bar code sub-blocks, but caution SHALL be exercised to prevent text from intruding on the 0.25 -inch quiet zones of each symbol.
- Bar Code Data Limit: The total number of characters in the two linear bar codes combined, including Data Identifiers, SHALL NOT exceed 16 characters. (For example, if the first linear bar code data field contains 7 characters including the Data Identifier, the second linear bar code data field may contain a maximum of 9 characters including the Data Identifier).
- The first (left-most) bar code sub-block SHALL conform to all specifications for Bar Code Building Blocks as stated earlier in this section under the subtitle Bar Code Building Block Contents.
- The second (right-most) bar code sub-block SHALL conform to specifications for Bar Code Building Blocks, plus the following:
- Block Title Line(s): A title SHALL be printed in conformance with the Bar Code Building Block rules, except that the title SHALL be printed in the lower left corner of the sub-block.
- Bar Code Symbol Placement: The bar code symbol SHALL be printed in the upper portion of the sub-block.
- Human Readable Interpretation: The human readable interpretation of the data encoded in the bar code symbol SHALL be printed below the bar code symbol.

# Trading Partner Labels Using Linear and 2D Symbols 

### 5.0 LABEL FORMAT

This guideline defines rules for formatting the information that appears on a shipping label. This section includes the formatting rules for the following:

- Building blocks and sub-blocks.
- Text in building blocks.
- Bar code in building blocks.
- General label characteristics

### 5.1 Building Blocks

The building block is the basic unit of the label format.
A modular structure is used to simplify label formatting. An individual building block or sub-block may contain the following:

- Text or graphics,
- A single bar code with human readable interpretation,
- A single 2D symbol,
- A linear bar code and a 2 D symbol, or
- May be blank.

Building blocks SHOULD be stacked vertically
Each building block may be produced separately or in combination with other building blocks. This provides the option of printing data, as it becomes known. See Figure 4.

A horizontal line SHOULD separate building blocks from each other. See Figure 4.

## Trading Partner Labels Using Linear and 2D Symbols

Figure 4. Building Block Types and Size

### 5.2 Building Block Size

Building block height SHALL be 1.0 inch $+/-0.2$ inch $(25 \mathrm{~mm}+/-5)$ as determined by the printing capability of the labeler.

The width of a building block is the width of the label.
A maximum of one double-height bar code block may be used per segment (See Section 7.3 and Figure 1). The double-height block can be used to satisfy special scanning requirements (for example, automated conveyor scanning or long range scanning).

Double-height bar code blocks SHALL be 2 inches +/- 0.4 inch ( $51 \mathrm{~mm}+/-10 \mathrm{~mm}$ ). See Figure 4.
Two half-height text building blocks may be used per segment. The half-height building block may only contain text or graphics, not bar code symbols.

# Trading Partner Labels Using Linear and 2D Symbols 

### 5.3 Sub-blocks

A sub-block SHALL be the full height, but less than the full width, of the building block. Vertical lines SHOULD be used between sub-blocks and SHALL be used to separate two adjacent text sub-blocks. See Figure 4.

Building blocks SHALL NOT be divided into more than four sub-blocks. The minimum width of a subblock SHALL be determined by the amount of data that will be printed in that sub-block.

### 5.4 Text Building Block Format

Figure 5 shows the format of a text building block.

Figure 5. Text Building Block

### 5.5 Text Building Block

A text building block or sub-block may contain text or graphics or both. A text building block or subblock SHALL NOT contain a bar code symbol. See Figure 3, which contains bar codes.

### 5.5.1 Text Lines-Per-Block

The height of text characters SHALL be specified using a unit of measure called Lines Per Block (LPB), rather than inches, millimeters, or points. This enables the printer of the label to determine the actual height and font of text for a given LPB, within the guidelines provided.

The exact character heights corresponding to the eight text sizes SHALL be chosen by the labeler based on the capabilities of the printing process. Eight sizes may be specified for text, ranging from one to eight Lines-Per-Block (LPB). See Figure 6.

## Trading Partner Labels Using Linear and 2D Symbols

| AIAG1234567890PQVS AIAG1234567890PQVS AIAG1234567890PQVS AIAG1234567890PQVS AIAG1234567890PQVS AIAG1234567890PQVS AIAG1234567890PQVS AIAG1234567890PQVS |  |

### 5.6 Text Dimensions

Labelers SHALL choose a single text height for each of the eight sizes so that clear distinctions SHALL be evident between text sizes. For example, 8 LPB text SHALL be smaller than 7 LPB text, etc. Figure 6 illustrates 1 through 8 LPB printing.

Characters SHALL be clearly legible, regardless of height. For maximum legibility the ratio of the height to width of a character SHOULD NOT exceed 2:1. The ratio of the height to width is measured on an " M " character. A sans serif font such as Arial or Helvetica is recommended.

## Trading Partner Labels Using Linear and 2D Symbols

### 5.7 Text Data Limits

The maximum number of text characters per line in a full width block that can be required of a labeler, regardless of the width of the label supplied, SHALL be limited to those shown in the column "Maximum Characters Per Line" in Table 1, below.

Table 1. Suggested LPB Character Parameters

| Lines Per Block | Maximum Characters Per Line | Approximate Point Height | Approximate Height in Inches | Approximate Height in Millimeters |
| :---: | :---: | :---: | :---: | :---: |
| 1 LPB | 8 | 64 | 0.90 | 22.0 |
| 2 LPB | 18 | 32 | 0.40 | 11.0 |
| 3 LPB | 28 | 20 | 0.25 | 7.0 |
| 4 LPB | 34 | 16 | 0.20 | 5.0 |
| 5 LPB | 42 | 12 | 0.15 | 4.0 |
| 6 LPB | 48 | 10 | 0.12 | 3.0 |
| 7 LPB | 59 | 8 | 0.10 | 2.0 |
| 8 LPB | 68 | 6 | 0.08 | 1.5 |

NOTE: Calculation of Maximum Characters Per Line is based on a block/label width of 6 inches. Calculation of approximate heights is based on a block height of 1 inch. Actual text dimensions will depend on the data, the font used, and the capability of the label provider's printer and software.

### 5.8 Titles For Text Building Blocks and Sub-blocks

A title may be used in a text building block. When used, it SHALL be printed in the upper left corner of the building block or sub-block.

Sans serif fonts (such as Arial or Helvetica) are preferred, but not required. If possible, a font that clearly differentiates the letter $O$ from the number 0 (as with a dot or line in the number 0 ) SHOULD be used.

The title in a text building block SHALL be printed in upper case characters at a height of 6, 7, or 8 LPB, two lines maximum, left justified. See Figure 6.

# Trading Partner Labels Using Linear and 2D Symbols 

Figure 7. Bar Code Building Block

### 5.9 Bar Code Building Block

The linear symbologies Code 39 or Code 128, with Data Identifiers (DIs) SHALL be the linear symbologies used in a bar code building block. See Section 4 for Code 39 and Code 128 Specifications.

A building block SHOULD NOT contain more than one linear bar code, but may contain a linear bar code and a 2D symbol. A sub-block of a building block SHALL NOT contain more than one linear bar code symbol.

Guidelines for implementing two sub-blocks with linear bar code symbols are found in Section 4.7 Side-by-Side Bar Code Block.

The single bar code sub-block SHALL be the leftmost sub-block within a building block.
All Code 39 or Code 128 bar code symbols SHALL contain a Data Identifier (DI). DIs are not considered part of the data they precede. The Data Identifier SHALL conform to the ANSI MH10.8.2, Data Application Identifier Standard. See Normative References.

### 5.10 Bar Code Data Limit

The total number of characters (excluding start/stop) per linear bar code in a building block or sub-block SHALL NOT exceed 19. The count of the total number of characters includes both data and DI characters.

### 5.11 Bar Code Block Title Line(s)

A title SHALL be printed in the upper left corner of the bar code building block or sub-block. See Figures 3, 5 or 7. Note the exception for Side-by-Side bar codes discussed in Section 4.7.

The title SHALL be printed in upper case characters at a height of 6,7 , or 8 LPB , two lines maximum, left justified. The Data Identifier (DI) SHALL be shown in parentheses near the title and SHALL follow the title. See Figures 3 and 7.

The bar code block's title SHOULD comply with the suggested Short Titles shown in Appendix A of this guideline.

### 5.12 Bar Code Symbol Placement

The bar code symbol SHALL be placed in the lower portion of the bar code building block, as illustrated in Figures 2 and 7. Note the exception for side-by-side bar codes discussed in Section 4.7 and Figure 3.

The bar code symbol SHALL be left justified allowing for the quiet zone as specified under Section 4.3 and Figure 2.

When used, a bar code sub-block SHALL be the leftmost sub-block within a building block.

### 5.13 Bar Code Symbol Height

The minimum height of the bar code symbol SHALL be 0.5 inch ( 13 mm ). See Figure 7.

### 5.14 Label Characteristics

Labels SHALL be white, with black print. They SHALL NOT use color for the following reasons:

1. COST
2. The process can be broken too easily due to supply constraints.
3. Approximately $10 \%+$ of the male population has some form of colorblindness.

# Trading Partner Labels Using Linear and 2D Symbols 

### 5.15 Label Height

The full label height will be determined by the number of building blocks included on the label.
The intended height of a building block is 1 inch, so the height of the label will be 1 inch times the number of building blocks.

### 5.16 Label Width

The width of the label SHALL be determined by the labeler.
Table 2, below, provides guidance. For example, if the labeler intends to print all labels at an "X" dimension of 0.015 inch, label stock of 6 inches width SHOULD work for any trading partner labeling specification.

Table 2. Suggested Label Widths for Selected X Dimensions Using Code 39

| X DIMENSION | SUGGESTED LABEL WIDTH |
| :---: | :---: |
| 0.010 inch $(0.25 \mathrm{~mm})$ | 4 inches $(102 \mathrm{~mm})$ |
| 0.013 inch $(0.33 \mathrm{~mm})$ | 5 inches $(127 \mathrm{~mm})$ |
| 0.015 inch $(0.38 \mathrm{~mm})$ | 6 inches $(152 \mathrm{~mm})$ |
| 0.017 inch $(0.43 \mathrm{~mm})$ | 6.5 inches $(165 \mathrm{~mm})$ |

Note: Table 2 shows, for given " X " dimensions, the suggested label widths to accommodate the maximum number of 19 data characters.

The calculations were based on the following for Code 39: 19 characters of data identifier plus data (maximum allowable) plus the two characters of a start character and a stop character, plus two 0.25 -inch quiet zones, using a ratio of wide to narrow elements of 3:1.

## Trading Partner Labels Using Linear and 2D Symbols

Table 3. Suggested Label Widths for Selected X Dimensions Using Code 128

| X DIMENSION | SUGGESTED LABEL WIDTH |
| :---: | :---: |
| 0.010 inch $(0.25 \mathrm{~mm})$ | 3 inches $(64 \mathrm{~mm})$ |
| 0.013 inch $(0.33 \mathrm{~mm})$ | 3.5 inches $(77 \mathrm{~mm})$ |
| 0.015 inch $(0.38 \mathrm{~mm})$ | 4 inches $(83 \mathrm{~mm})$ |
| 0.017 inch $(0.43 \mathrm{~mm})$ | 4.5 inches $(102 \mathrm{~mm})$ |

The calculations for Table 3 used the same character count as Table 2.

# Trading Partner Labels Using Linear and 2D Symbols 

### 6.0 LABEL DATA CONTENT

This guideline defines label format, not label content. However, certain information is widely needed for specific application uses of labels. This section describes the recommended data for:

- Unique identification for container content labels
- Identifying individual containers for shipment
- Identifying master pack containers for shipment
- Identifying mixed load containers for shipment
- Identifying entire shipments in conjunction with EDI
- Ship-to and ship-from text format

Although no specific data is mandated, a Unique Container Identifier is highly recommended for traceability throughout the supply chain, as specified in the following section.

The customer is the final arbiter of what data is mandatory.

### 6.1 Unique Container Identifier (License Plate)

Containers SHOULD be uniquely identified each time they are shipped, using a Unique Container Identifier, commonly referred to as a license plate.

The Unique Container Identifier, if used, SHALL be contained in either one or two linear bar code symbols as described in the following sections.

A Unique Container Identifier is a numeric or alphanumeric code that uniquely identifies a container for traceability for a single shipment within the channel of distribution.

Such identification consists of three elements:

- A package identifier for the container, assigned by the supplier.
- A controlled number for vendor identification,
- A means to identify the controlling authority that assigned the vendor identification number (this is identified by the DI)

The Unique Container Identifier SHALL NOT be repeated to a given customer within a minimum period of 366 days.

# Trading Partner Labels Using Linear and 2D Symbols 

### 6.1.1 Unique Container Identifier Using One Building Block

When a single building block is used for the Unique Container Identifier, it SHALL comply with the rules for a Unique Transport Unit Identifier as defined in ISO/IEC 15459, using the Data Identifier "15" for individual packages and " 2 J " for Master and Mixed Loads.

A container may be uniquely identified by using a single building block containing only text, or a single linear bar code.

The Unique Transport Unit Identifier is defined in ISO/IEC 15459 as follows;

- When using a single linear barcode, uses the appropriate Data Identifier (1J or 2J);
- Is unique and SHALL NOT be repeated to a given customer within a minimum period of 366 days;
- The data starts with an Issuing Agency Code (IAC) assigned to the issuing agency by the Registration Authority identified by ISO;
- Conforms to a format specified by the issuing agency;
- Contains only upper case alphabetic and numeric characters.

The purpose of highlighting lines is to assist users in visually locating the Unique Container Identifier. Highlighting lines SHOULD be used above and below the single building block. Highlighting lines SHALL NOT be used elsewhere on the label. Highlighting lines SHALL be easily distinguishable from the other horizontal separator lines.

### 6.1.2 Unique Container Identifier Using Two Building Blocks

A container may be uniquely identified by using two building blocks containing an identification of the supplier and an identification of the container number of the container, as assigned by the supplier. When two building blocks are used for the Unique Container Identifier, the building blocks SHALL be contiguous, with the supplier identification building block above the container/package identification block.

The combination of the two building blocks SHALL be unique and SHALL NOT be repeated to a given customer within a minimum period of 366 days.

When a bar code symbol is used, the appropriate Data Identifier (DI) from the ANSI MH10.8.2 Data Identifier Standard SHALL be used. A brief list of some data identifiers from the ANSI MH10.8.2 Data Identifier Standard can be found in Appendix A of this document.

Highlighting lines SHOULD be used above the supplier identification block and below the container/package identification number building block. The purpose of highlighting lines is to assist users in visually locating the Unique Container Identifier. Highlighting lines SHALL NOT be used elsewhere on the label. Highlighting lines SHOULD be easily distinguishable from the horizontal separator lines. See Figure 8.

# Trading Partner Labels Using Linear and 2D Symbols 

Figure 8. Double Building Block License Plate

Note: Bar Code in this example is Code 128.

### 6.2 Single Pack Label - A Single Container of the Same Part Number

A unique container unit identifier or "license plate" is the key that provides access to information stored in computer files and that may be transmitted by EDI. The identifier may be used by all of the trading partners to retrieve information about the transport unit itself or about the status of the physical movement of the transport unit along the supply chain. It enables systems to track and trace individual transport units.

A Single Pack Label SHOULD be used to identify the contents of an individual container of a single part number for a shipment. A Unique Container Identifier SHOULD be assigned to each single pack. See Section 14 Examples.

When used, the Unique Container Identifier SHALL NOT be repeated to a given customer within a minimum period of 366 days. When multiple labels are used on a container all labels SHALL be identical, including the package identifier.

The Data Identifier for package identification for a single container SHALL be either:

- " 1 J " when a single building block is used, or

# Trading Partner Labels Using Linear and 2D Symbols 

- "3S" when two building blocks are used.

### 6.3 Master Load Label - Multiple Single Packs of the Same Part Number

A Master Load Label SHOULD be used to identify the total contents of a multiple single pack load of the same part number. For an example, see Section 14 Examples.

Master Labels are similar to single pack labels with the following exceptions:

- Ship-From and Ship-To addresses SHOULD be used when applicable.
- The Master Load Label SHOULD be easily identified with human readable text. A text subblock containing the words "MASTER LABEL" in upper case SHALL be printed in either the Customer Segment or the Supplier Segment of the label at a minimum height of 3 LPB.

The Data Identifier for a package identification in a bar code on the Master Load Label SHALL be either of the following;

- " 2 J " when a single building block is used, or
- " 4 S " when two building blocks are used.
" Note that the " 4 S " would also appear in parentheses in the title, as:
PKG ID - MASTER (4S)
- The quantity on the Master Load Label SHALL be the accumulated total of all single pack quantities on the load.
- All other data in the customer segment of the Master Load Label SHALL be specified by the customer.

When used, the Master Load Label SHOULD be placed in such a manner that when the pack is broken apart, the Master Load Label can be discarded.

When used, the Unique Container Identifier SHALL NOT be repeated to a given customer in a period of less than 366 days.

When multiple labels are used on a container all labels SHALL be identical, including the package identifier.

Each single pack of the multiple pack SHOULD be identified with a Single Pack Label.

## Trading Partner Labels Using Linear and 2D Symbols

### 6.4 Mixed Load Label

A Mixed Load Label SHALL be used to identify a load of multiple single packs of different part numbers.

Mixed Load Labels SHALL conform to the following specifications:

- Ship-From and Ship-To addresses SHOULD be used when applicable.
- A text sub-block containing the words MIXED LOAD in upper case SHALL be printed in either the Customer Segment or the Supplier Segment of the label at a minimum height of 3 LPB.

The Data Identifier for package identification when used in a bar code on the Mixed Load Label SHALL be either of the following:

- " 2 J " when a single building block is used, or
- " 5 S" when two building blocks are used.
- All other data in the customer segment of the Mixed Load Label SHALL be specified by the customer.

When multiple labels are used on a container all labels SHALL be identical, including the package identifier.

When used, the Unique Container Identifier SHALL NOT be repeated to a given customer within a minimum period of 366 days.

Each single pack of the mixed load pack SHOULD be identified with a Single Pack Label.

# Trading Partner Labels Using Linear and 2D Symbols 

### 6.5 Ship-From and Ship-To

This section defines Ship-From and Ship-To building block usage.

Figure 9. Ship-From and Ship-To Building Blocks

NOTTO SCALE
Note: Bar Code in this example is Code 128.

### 6.5.1 Ship-From and Ship-To Text

Ship-From and Ship-To addresses SHOULD be used when applicable.
The Ship-From sub-block SHALL have a title of "FROM:" and the Ship-To sub block SHALL have a title of "TO."

Ship-From characters SHALL be noticeably smaller than the Ship-To characters. The difference in size makes it easier for carrier personnel to distinguish the destination from the return address. For example, if the Ship-To address is printed at 5 LPB, then the Ship-From address SHOULD be printed at 6 or 7
LPB.
When the Ship-From and Ship-To addresses are placed side by side the Ship-From address SHALL be placed to the left of the Ship-To address. It is recommended that the Ship-From and Ship-To addresses be placed side-by-side in a single building block, rather than using two building blocks for addressing information.

## Trading Partner Labels Using Linear and 2D Symbols

When placed side by side, the Ship-From address SHOULD be separated from the Ship-To address by a vertical line.

If the Ship-From and Ship-To addresses are placed in separate building blocks the Ship-From address SHALL be located above the Ship-To address. To ensure that the package arrives at the correct destination, the Ship-To address SHALL NOT be located above the Ship-From address.

# Trading Partner Labels Using Linear and 2D Symbols 

### 7.0 QUICK RECEIVE LABEL

### 7.1 Introduction

The process described in this section promotes cost reduction benefits at shipment levels for partial or completely loaded trucks, rail cars, sea vans or other controlled arrangements of containers. This timesaving option of making material receipts uses both bar code and Electronic Data Interchange (EDI). The process is called "Quick Receive."

The Quick Receive process facilitates the integration of minimal bar code scanning and the ANSI ASC X12 856 Ship Notice/Manifest, known in the automotive industry as the Advance Ship Notice (ASN). This integration allows receipts to be made at shipment levels, requiring little or no manual data entry. The time consumed in scanning individual container labels and inquiring to determine if the ASN was sent from supplier to customer is eliminated.

As an aid in planning and implementing an efficient receiving process, this guideline recommends a method using data encoded in Code 39 or Code 128 bar codes with an electronic ASN to receive material at the shipment level.

### 7.2 Business Process

The combination of a Quick Receive Label and the ASN provides significant benefits to automotive and related industries. Following is a description of the typical business logistics process performed by suppliers and customers.

## Suppliers:

- Place bar code shipping labels on the material according to customer requirements.
- Assign a control number to the ASN.
- Develop the ASN from shipment data.
- Print a Quick Receive Label containing the ASN control number and attach to the freight bill, bill of lading, or packing list (attached to document customer will retain after signing for freight/delivery.) For smaller cartons and/or packages, such as those sent via package carriers, where each package is defined as a shipment, the Quick Receive label can be placed directly on the carton near the "Ship To" address.
- Transmit the ASN to the customer.
- Send the shipment to the customer.

# Trading Partner Labels Using Linear and 2D Symbols 

## Customer:

- Receive the supplier ASN from the electronic mailbox and store data.
- Scan the Quick Receive Label, process the scanned data against the ASN data file, and receive shipment.

### 7.3 Purpose of the Quick Receive Label

The purpose of the customer Quick Receive Label is to match a supplier's incoming material to the information on the supplier's EDI ASN (856). To accomplish this, the information on the Quick Receive Label SHALL uniquely identify the shipment for the customer.

Using the "building block" design outlined in section 5.0, a Quick Receive Label can be constructed using one, two, or three building blocks.

### 7.3.1 One Building Block

If the Shipment Identification (SID) uniquely identifies the shipment for the customer, a single building block can be used. See Figure 10. If the SID is encoded in a bar code symbol, the maximum length SHALL be 19 characters, including the Data Identifier (DI) " 2 S ." The title SHALL be "(2S) ASN SHIPMENT ID/QUICK RECEIVE."

Figure 10. Shipment Identification (SID) uniquely identifies shipment.

## NOT TO SCALE

Note: Bar Code in this example is Code 128.

### 7.3.2 Two Building Blocks

If the SID does not uniquely identify the shipment for the customer, or the bar code in the SID is more than 17 characters, two building blocks SHALL be used, one to identify the supplier and one to identify the shipment. See Figure 11. If either or both building blocks contain bar codes, the maximum is 19 characters per building block, including DI's. For the supplier identification, if the ASN ISA 05 segment is a one ( 1 ), use DI " 13 V ".

Figure 11. Shipment Identification (SID) does not uniquely identify shipment

NOT TO SCALE
Note: Bar Code in this example is Code 128.
If the ASN ISA 05 segment is ZZ, use Data Identifier "V". For the shipment identification, the DI SHALL be " 2 "". See Figure 12. The title SHALL be "(2S) ASN SHIPMENT ID/QUICK RECEIVE."

## Trading Partner Labels Using Linear and 2D Symbols

Figure 12. Example of Data Identifier "V".

NOT TO SCALE
Note: Bar Code in this example is Code 128.

### 7.3.3 Additional Building Block

If trading partners agree that the human readable text "Quick Receive" SHOULD be a full building block on the label, an additional building block SHALL be used. This block SHOULD be the topmost block of the label.

Figure 13. Text Block Added And Shipment Identification (SID) Uniquely Identifies Shipment.

## NOT TO SCALE

Note: Bar Code in this example is Code 128.

# Trading Partner Labels Using Linear and 2D Symbols 

Figure 14. Text Block Added And Shipment Identification Does Not Uniquely Identify Shipment.

## NOT TO SCALE

Note: The Bar Codes in this example are Code 128.

# Trading Partner Labels Using Linear and 2D Symbols 

### 8.0 SYMBOLOGY QUALITY

To ensure consistent and effective reading of the bar code and 2D symbologies throughout the supply chain, following a quality plan is paramount. The following section outlines minimum requirements.

### 8.1 Quality Assurance

Quality testing SHOULD NOT be limited to label production inspection but SHOULD be tested through to the end use.

It is important that the bar code be decodable throughout the system. For this reason, quality needs to be considered from initial printing through to the end user.

The AIAG B-8 document is a guide for determining quality assurance for shipping labels and other bar code applications (both linear and 2D).

### 8.2 Bar Code Print Quality

ISO/IEC 15416 - Bar code print quality test specifications - Linear symbols, describes the parameters used for evaluating a printed bar code symbol. The test result is a print quality grade, either numeric $(4,3,2,1,0)$ or alphabetic (A, B, C, D, F). The ISO/IEC 15416 SHALL be used to determine bar code symbol print quality.

When bar code print quality tests are performed an appropriate verifier with a measurement aperture of 0.010 inch and illumination wavelength of $630-680$ nanometers SHALL be used.

The minimum symbol grade SHALL be C (1.5).
These symbol quality and measurement parameters ensure scannability over a broad range of scanning environments.

In addition, it is recommended that quality measurements be taken under consistent conditions; that is, use the same background lighting and the same surface on which the label will be attached.

[^0]
### 8.3 Sampling

Appropriate statistical process control (SPC) techniques SHOULD be used.

# Trading Partner Labels Using Linear and 2D Symbols 

The sample size must be sufficiently large to be statistically valid within the size of the lot or batch being inspected. Acceptable quality levels must be established prior to quality control inspection.

In addition to statistical sampling, additional points in the process where verification is appropriate include the following:

- When printer is first turned on,
- After changing ribbons,
- After changing toner,
- After changing ink,
- Any time the label stock is changed,
- Beginning of a shift, and
- After maintenance is performed on the printing equipment.

### 8.4 Obsolete Labels

Obsolete labels SHALL be rendered unusable by being removed, defaced, or covered.
If covering obsolete labels with new labels, care SHOULD be taken so that the bar code print quality of the new labels is not adversely affected.

If the label stock is not sufficiently opaque, the print from the label underneath can show through and decrease the print contrast. The new label must meet the ANSI bar code print quality requirements.

### 8.5 Label Durability

Labels SHOULD be sufficiently durable to remain in place and be decodable throughout the system of use.

Numerous environmental effects can lead to the degradation of the bar code symbol, whether they are optical or physical, affecting its substrate, adhesive, or laminate. These changes may affect one or more of the quality parameters of the label. The net effect of such changes can render the label unusable. It is therefore important to consider these effects when producing and applying bar code labels.

Some of the factors that SHOULD be considered include temperature, humidity, light exposure, abrasion, chemical contamination and aging.

Military Specification MIL-L-61002, "Labels, Pressure Sensitive Adhesive, for Bar Codes and Other Markings" is a good source for information on environmental factors, consideration, and testing. The following sections of that document are relevant for review.

# Trading Partner Labels Using Linear and 2D Symbols 

- 3.2.2 "Performance Test Parameters"
- 4.6 "Performance Tests"
- 6.11 "Application Examples"

### 8.6 Recyclability

If the label is to be attached to a material that is to be recycled, the label material SHOULD be compatible with or removable from the substrate material to which it is attached.

An example of a recyclable material is shrink-wrap.

### 9.0 LABEL PLACEMENT AND ORIENTATION

As described in Section 7 Label Concepts, this guideline uses segments for logical grouping of information. In this section, rules for placement and orientation of label segments are defined and illustrated.

### 9.1 Segment Placement

Label segments SHOULD be stacked vertically. Stacking vertically ensures that the bar codes do not interfere with each other when scanning. See Figure 16 below.

As illustrated below, the Carrier Segment of the label SHOULD be the topmost segment. Parcel carriers may require the placement of carrier information (such as addresses) on the top of the transport container.

Due to physical package constraints, it may not be possible to stack all segments vertically. Under these circumstances it is important to position the segments of the label so that bar code blocks are not directly adjacent. Placing bar code symbols side by side can interfere with accurate bar code scanning.

Figure 16. Label Segments
SEGMENTS

### 9.2 Placement

Labels SHOULD be placed no closer than 1.25 inches ( 32 mm ) from any container edge. See Figure 17.
Label placement toward the center of the sides of rectangular corrugated containers SHOULD be avoided.

When label locations are identified on customer containers (especially on returnable containers), they SHALL NOT be applied outside the defined area.

## Trading Partner Labels Using Linear and 2D Symbols

Because labels must be accessible for scanning at shipping, transportation, and receiving operations, labels or tags SHOULD be applied in an easily accessible location. See Figures 18a and 18b for guidance on label placement for various types of containers.

When multiple labels are used on a container, all labels SHALL be identical, including the package identifier.

The label SHOULD NOT be placed over a seam.
Sealing tape, shrink-wrap, or bands SHALL NOT be placed over the label. These will interfere with the scanning of the label.

The following considerations SHOULD be addressed when determining the most appropriate location for the label or segments of the label:

- Survivability of the label,
- Label application (manual/automatic, label/tag /direct marking),
- Container type,
- Packaging level (if multiple labels or bar code symbols are visible),
- Accessibility of location.

Each supplying location SHALL be responsible to ensure that bar code marked labels and tags are sufficiently secured and protected and applied wrinkle-free so that they are readable at the point of final customer usage.

### 9.3 Label Placement on Master and Mixed Loads

For master and mixed loads the label SHALL be placed on the upper half of the unit load. The bottom edge of the label SHOULD NOT be higher than 60 inches $(152 \mathrm{~cm})$ from the bottom.

### 9.4 Orientation

Labels SHOULD be placed on the side of the container with the bars perpendicular ( $+/-5$ degrees) to the natural bottom of the container. See Figure 17. When a label is placed on the top of a container, the bars SHOULD be perpendicular to the edge of the container and SHOULD NOT be placed over a seam.

## Trading Partner Labels Using Linear and 2D Symbols

Figure 17. Label Orientation

Figure 18. Suggested Label Placement

Caution: All labels on the container must be identical.
Obsolete labels SHALL be rendered unusable by being completely removed, defaced, or covered.

UBING AND BARS

### 10.0 WHEN TO USE A 2D SYMBOLOGY

The primary advantage of 2D symbols is increased information density - the number of characters that can be encoded in a given amount of label area. Smaller machine-readable symbols could result in label size reduction, therefore, a cost savings.

In environments where symbol damage is likely, the error correction capability of 2D symbols may increase read-rates. These symbols may be used as additions to, or replacements for, linear bar codes currently used on a label. Generally, any time a large amount of machine readable information is required on the label and/or label space is limited, 2D symbols are a potential solution. Table 4 gives examples of circumstances in which 2D symbols could be used.

Table 4. When To Use 2D Symbologies

| Situation | Solution |
| :--- | :--- |
| Goods in a distribution environment may be sorted by <br> several data elements without the aid of an on-line <br> database. | All data fields can be encoded in a single symbol. |
| Additional logistics services are required of the carrier, but <br> shipment information may not be transmitted until after <br> the carrier's first process point. | Print the information on the shipment in a 2D symbol. |
| Available label space is insufficient to encode all <br> necessary data elements in linear bar code symbols. | Encode the data from several linear symbols in a single <br> 2D symbol. |
| Freight/packages sometimes arrive before the EDI <br> transaction from the supplier. | To supplement the EDI transaction, information about <br> the shipment could be encoded in a 2D symbol on the <br> label. |
| Receiving materials/parts is time-consuming and error- <br> prone because of manual inventory entry or the need to <br> scan each individual item. | The contents of an entire shipment may be contained in a <br> 2D symbol(s) to permit rapid and accurate entry to the <br> inventory database. |
| The cost of labeling is increasing due to the number of bar | 2D codes can contain all the information of the |

# Trading Partner Labels Using Linear and 2D Symbols 

| Situation | Solution |
| :--- | :--- |
| code symbols required to communicate the desired <br> information in the label space available. | conventional bar codes in a fraction of the label space. |
| Bar code read reliability on cartons, pallets, and containers <br> is reduced because of harsh environments, causing the <br> symbols to be unreadable, requiring considerable and <br> labor- intensive manual reconciliation. | 2D symbology offers sophisticated error correction <br> capabilities which provide a higher probability of a <br> successful read, even with considerable symbol damage. |
| Taking inventory requires the scanning of multiple linear <br> bar codes for each container/pallet. This reduces <br> productivity and increases the duration of the inventory <br> process. | A single 2D symbol used to identify the container and its <br> contents can be scanned during inventory, providing all <br> the required information. |
| In certain segments of the materials pipeline, there may be <br> no connection to a computer database and no access point <br> to all of the information needed to efficiently receive, <br> inspect, sort, and distribute these materials. | The 2D symbol on the B-10 can contain all information <br> required to identify, receive, inspect, and stock or <br> distribute materials. |
| Because paperwork may travel independently of the <br> shipment, delays and administrative costs are sometimes <br> involved in getting materials, parts, and/or product <br> through customs. | In a 2D symbol on the B-10, the customs information <br> could travel with the shipment in machine-readable form. |

# Trading Partner Labels Using Linear and 2D Symbols 

### 11.0 WHICH SYMBOLOGY TO USE

This section provides guidance for choosing which symbology is appropriate for your application. It is especially important to note that 2D symbologies generally require special equipment for reading and printing. It is advisable to check with your trading partner(s) before implementing a program that requires the use of 2 D symbols.

Unless otherwise noted, data for these applications may be represented in any of the formats described in Section 12.3 Data Formats. Data formats are independent of applications, although some applications may require specific formats. Data formats may be combined to represent application data, with the exceptions of those noted in Section 12.3 Data Formats.

### 11.1 Shipping and Receiving

The Shipping and Receiving application requires information that facilitates staging, transportation, and receipt of goods and materials. This information may include transportation, product, transactional and quality data, as well as structured text and mutually defined formats. For this application the 2D symbol(s) will be placed on a label as outlined in this guideline.

### 11.1.1 Symbology Recommendation

When a two-dimensional symbol is used for the Shipping and Receiving application, 2D symbology PDF417 SHALL be used.

### 11.1.2 Symbol Titles

Each 2D symbol SHOULD use a title to describe the intended user of the data. The printer of the label SHOULD select one or a combination of the following titles to best describe the intended user(s). When combined, the titles SHOULD be separated by a slash "/" character.

Table 5. Symbol Titles

| Symbol <br> Title | Intended <br> User(s) |
| :---: | :---: |
| CARR | Carrier |
| SPLR | Supplier |
| CUST | Customer |

### 11.1.3 Data Format Usage

Only Data Format " 06 " is recommended for use under this guideline.

## Trading Partner Labels Using Linear and 2D Symbols

### 11.2 Carrier Sortation and Tracking

Carrier Sortation is the process in which packages are routed between two or more points. Carrier Tracking is the process by which the location of unit loads and transport containers being transported by a carrier is updated in the carrier's database.

The symbol includes the information that is required to route unit loads and transport containers between multiple points, locate unit loads and transport containers, and provide other supporting data that is relevant to the Sortation and/or Tracking process for internal or external processing.

### 11.2.1 Symbology Recommendation

When a 2D symbol is used for the Carrier Sortation and Tracking application, the MaxiCode symbology SHALL be used.

### 11.2.2 Special Considerations

This Guideline recommends the use of a single MaxiCode symbol for Carrier Sortation and Tracking data. A second MaxiCode symbol can be added if more information is required. Both MaxiCode symbols SHALL be encoded in the same mode (See subsection 13.2.3 Symbol Encoding.)

When a carrier is using MaxiCode for automated sortation, the Data Format "01" SHALL appear in the MaxiCode symbol.

### 11.2.3 Data Format Usage

Only Data Format " 06 " is recommended for use under this guideline.

# Trading Partner Labels Using Linear and 2D Symbols 

### 12.0 MESSAGE FORMAT

This section defines how data SHALL be formatted within a 2D symbol or set of concatenated 2D symbols. The data within a 2D symbol or set of concatenated symbols SHALL be called a data stream.

To allow multiple data formats to be contained within a data stream, a two-level structure of enveloping is used. The outermost layer of the message is called a Message Envelope and defines the beginning and end of the message. Within the Message Envelope are one or more Format Envelopes that contain data (see Figure 19). Reference ISO 15434 for details beyond those listed in this guideline.

Only ANSI MH10.8.3, Format " 06 " is recommended for use in this guideline.

The message envelope SHALL consist of the following, in order:

- A Message Header
- A Message Trailer (when required)

Each format envelope within the message envelope SHALL consist of the following, in order:

- A Format Header
- A Format Trailer (when required)

## Trading Partner Labels Using Linear and 2D Symbols

Figure 19. Pictorial Illustration of Enveloping Structure

### 12.1 Message Envelope

The Message Envelope defines the start and end of the data contained within the data stream and provides the following functions:

- Indicates that the message contained within this symbol is formatted in compliance with the rules of this guideline
- Indicates the character which has been defined to separate Formats within this Message
- Provides a unique character to indicate the end of the Message

The structure within a data stream is as follows:

- A Message, containing one or more Formats

## Trading Partner Labels Using Linear and 2D Symbols

- A Format, containing one or more Segments
- A Segment, containing one or more Data Elements
- A Data Element (field), potentially containing one or more Sub-elements (Subfields).

### 12.1.1 Message Header

The Message Header consists of two parts, as illustrated in Figure 19:

- The three-character Compliance Indicator "[ ) >"
- NOTE: Without any spaces between characters; spaces are added to this example for visual clarity only.
- The Format Trailer Character ${ }^{* R} \mathrm{R}_{\mathrm{s}}$ "

The complete Message Header is: [ ) >

- NOTE: This example is shown correctly spaced

### 12.1.1.1 Compliance Indicator

The Compliance Indicator SHALL be the first three characters in the Message Header. The Compliance Indicator SHALL be [ ) > (left hard bracket, right parenthesis, greater than). See Appendix G for a table of ASCII decimal and hexadecimal values.

### 12.1.1.2 Format Trailer Character

The Format Trailer Character SHALL be the fourth character in the Message Header. The Format Trailer Character SHALL be the non-printable ASCII character represented as "R" (see Appendix G). The Format Trailer Character is used throughout the message to indicate the end of a Format Envelope. See Figure 19.

### 12.1.1.3 Message Trailer

The Message Trailer identifies the end of the message within the data stream. The Message Trailer SHALL be the nonprintable ASCII End Of Transaction character, " ${ }^{\mathbf{E}} \mathbf{O}_{\mathbf{T}}$ " (see Appendix G). The Message Trailer character SHALL NOT be used elsewhere in the message. See Figure 19.

## Trading Partner Labels Using Linear and 2D Symbols

### 12.2 Format Envelope

The Format Envelope defines the start and end of data in a given Format and provides the following functions:

- Identifies the data Format used within the envelope
- Defines the character(s) used to separate the Segments, Data Elements (Fields), and Subelements (Sub-fields) within this data Format
- Indicates any applicable date, release, or control information

### 12.2.1 Format Header

A Format Header SHALL consist of two parts:

- A Format Indicator (a two-digit numeric identifier which identifies the rules governing the Format).
- Variable data (if any) that defines the separators used, version, release, date, or control information of the applicable standards.

### 12.2.2 Separators and Terminators

The Separator and Terminator are an integral part of the data stream. The Separator and Terminator characters SHALL NOT be used in non-binary data elsewhere in the message.

### 12.2.2.1 Data Element Separator

Data elements in Format "06" SHALL be separated by the non-printable Data Element Separator character " $\mathrm{G}_{\mathrm{s}}$. Refer to Appendix G.

### 12.2.3 Format Header "06" - Data Using Data Identifiers

The Format Header for data using Data Identifiers SHALL be represented as:
$\mathbf{0 6}^{\mathrm{G}_{\mathrm{s}}}$
where:
$\mathbf{G}_{\mathbf{s}}$ is the Data Element Separator to be used between Data Fields.

### 12.2.4 Format Trailer

The Format Trailer identifies the end of a Format Envelope. The Format Trailer SHALL consist of the non-printable ASCII Format Trailer Character, "R" (refer to Appendix G). The Format Trailer Character SHALL NOT be used in non-binary data elsewhere in the message.

# Trading Partner Labels Using Linear and 2D Symbols 

### 12.3 Data Format

### 12.3.1 Format "06" - Using Data Identifiers

Each Data Element in the format SHALL be preceded by the appropriate Data Identifier (DI) code and followed by the Data Element Separator character ${ }^{\mathbf{G}}{ }_{\mathbf{s}}$. When the Data Element is the last field in the Data Format, the Data Element Separator is not used and the Data Element is immediately followed by the Format Trailer character ${ }^{\mathrm{R}} \mathrm{s}$.

### 12.3.1.1 Multiple Instances of Dls in Format " 06 "

Within any single Format "06" envelope, DIs SHALL NOT be duplicated. Where, within a message, multiple instances of a DI are required, each instance SHALL be encoded in a separate "06" Format envelope. Examples are shown in Appendix J of this document.

### 12.3.1.2 Ordering of Format " 06 " Data Elements

Within any " 06 " format, Data Elements with their associated DI's SHOULD be ordered according to Appendix D.

Table 6. Message Data for Format 06 Examples

| Data and formatting characters for <br> Format "06" | Comments |
| :--- | :--- |
| $06^{\text {G }}$ s | "06" Format Header |
| $52 \mathrm{~L} 48507^{\text {G }}$ s | 'Ship to' Postal Code |
| 12 V 123456789 G $_{\mathrm{s}}$ | Manufacturer's ID |
| $3 \mathrm{~S} 9999999999^{\text {G }}$ | Package ID - Unit |
| $\mathrm{R}_{\mathrm{S}}$ | Format Trailer |

The information in the 2D symbols on the label examples is encoded in Format " 06 ". In the examples, for the sake of simplicity, the data for Format 06 is encoded only in the PDF417 symbol. In actual use, either symbol could contain both formats as well as additional information.

In addition to the message data, the above formats will be bounded by the Message Header [) $>^{\mathbf{R}}{ }_{\mathrm{s}}$ and Message Trailer ${ }^{\mathbf{E}} \mathbf{0}_{\mathbf{T}}$ respectively when encoded into the symbols.

### 13.0 2D SYMBOLOGY SPECIFICATIONS

This section will provide guidance on which 2D symbologies to use for Shipping and Receiving, and Sortation and Tracking.

### 13.1 Shipping and Receiving

### 13.1.1 Symbology Requirement

This Guideline specifies the use of PDF417 symbology for the Shipping and Receiving application.
Truncated PDF417 and Macro PDF417 (defined in the AIM $_{\circledast}{ }^{\text {USA }}$ Uniform Symbology Specification PDF417) SHALL NOT be used for the Shipping and Receiving application.

### 13.1.2 "X" Dimension

The narrow element dimension ( X dimension) range SHOULD be from 0.010 to 0.017 inch ( 0.254 to 0.432 mm ) as determined by the printing capability of the supplier/printer of the label. Symbols with narrow elements at the lower end of this range may require special care to meet the print quality requirements of subsection 13.1.7 Print Quality. Conformance to the print quality requirements SHALL be determined according to subsection 13.1.7.

### 13.1.3 Bar Height

The PDF417 symbol SHALL have a minimum bar height (height of the symbol element) of three (3) times the width of the narrow element ( X dimension).

### 13.1.4 Symbol Size

PDF417 symbols SHALL fit within the building block structure outlined in Section 5. A symbol
SHALL NOT exceed a double-height block. A single-height block is 1.0 inch $\pm 0.2$ inch ( $25.4 \mathrm{~mm} \pm 5$ mm high), and a double-height block is 2.0 inches $\pm 0.4$ inch ( $50.8 \mathrm{~mm} \pm 5 \mathrm{~mm}$ ) high.

Tables H1 through H7 in Appendix H are provided as guidance when incorporating PDF417 symbols into the design of a shipping label. The actual achieved size of a PDF417 symbol may vary based on data content and printing process. The symbol sizes listed should accommodate most situations.

A PDF417 symbol SHOULD be printed with no more than 12 data columns in width. This will ensure readability by the broadest range of reading devices. Up to 18 data columns may be used but only with the agreement of trading partners.

# Trading Partner Labels Using Linear and 2D Symbols 

Table 7 below shows the width of PDF417 symbols (including quiet zones) with 12 data columns at different " $X$ " dimensions. For further information on data columns, symbol widths, character counts, and print densities, refer to Appendix H.

Table 7. Symbol Width Of A PDF417 Symbol Using 12 Data Columns

| X Dimension | PDF417 Symbol Width |
| :--- | :--- |
| 0.010 inch $(0.25 \mathrm{~mm})$ | 2.81 inch $(71.37 \mathrm{~mm})$ |
| 0.013 inch $(0.33 \mathrm{~mm})$ | 3.63 inch $(92.20 \mathrm{~mm})$ |
| 0.015 inch $(0.38 \mathrm{~mm})$ | 4.18 inch $(106.17 \mathrm{~mm})$ |
| 0.017 inch $(0.43 \mathrm{~mm})$ | 4.72 inch $(119.89 \mathrm{~mm})$ |

### 13.1.5 Quiet Zone

This guideline recommends that the PDF417 symbol have a quiet zone of 0.04 inch ( 1 mm ) above, below, to the left, and to the right. The quiet zone is included within the calculation of the size of the symbol.

### 13.1.6 Error Correction Level

Error correction levels of 3, 4 or 5 SHALL be used.

### 13.1.7 Print Quality

The $A I M_{\circledast}{ }^{\text {USA }}$ Uniform Symbology Specification PDF417 and ANSI X3.182 Bar Code Print Quality Guideline SHALL be used to determine the print quality of the PDF417 symbol. The minimum symbol grade SHOULD be 1.5/10/660, where:

- Minimum Print Quality grade $=\mathbf{1 . 5}(\mathrm{C})$ at the final point of receipt of the symbol
- Recommended Print Quality grade $\mathbf{\geq 2 . 5}$ (B) at the point of printing the symbol
- Measurement Aperture $=\mathbf{0 . 0 1 0}$ inch $(0.254 \mathrm{~mm})$
- Light Source Wavelength $=\mathbf{6 6 0}$ nanometers $(\mathrm{nm}) \pm 10 \mathrm{~nm}$

### 13.1.8 Orientation and Placement

### 13.1.8.1 Orientation

The bars of the PDF417 symbol SHALL be perpendicular to the natural bottom of the label. See Figure 20.

## Trading Partner Labels Using Linear and 2D Symbols

### 13.1.8.2 Label Placement

Labels SHALL be placed on packages as specified in this guideline.

Figure 20. Orientation Of PDF417 Symbol On Label

Note: Illustration is not to exact size or scale.

### 13.2 Carrier Sortation and Tracking

### 13.2.1 Symbology Requirement

When a two-dimensional symbol is used for the Carrier Sortation and Tracking application, MaxiCode symbology SHALL be used.

### 13.2.2 " $X$ " Dimension

MaxiCode is not a scaleable symbol (does not support different X dimensions). The MaxiCode symbol SHALL have an X dimension (the width of a symbol module) and all other dimensions consistent with the $A I M_{\circledast}{ }^{\text {USA }}$ Uniform Symbology Specification MaxiCode, measured at .035 inch $(0.89 \mathrm{~mm})$ yielding a symbol approximately 1 inch square.

### 13.2.3 Symbol Encoding

Code Set - When encoding information in a MaxiCode symbol, it is recommended that character selection be limited to Code Set A where possible. (Refer to AIM ${ }_{\circledast}{ }^{\text {USA }}$ Uniform Symbology Specification MaxiCode.)

Mode - A MaxiCode symbol incorporates one Mode per symbol. This Guideline recommends the use of MaxiCode Mode 2 or Mode 3 to ensure that the sortation system can decode the 'Ship To' Postal Code, 'Ship To' Country Code, and Class of Service in the event of symbol damage. (Refer to AIM ${ }_{\circledast}{ }^{\text {USA }}$ Uniform Symbology Specification MaxiCode).

## Trading Partner Labels Using Linear and 2D Symbols

The determination of which mode to use is established by the data characteristics of the 'Ship To' Postal Code and Class of Service. Table 8 below determines the appropriate Mode.

## Trading Partner Labels Using Linear and 2D Symbols

Table 8. Mode Determination for MaxiCode

| If The Ship To Postal Code Is: | And The Class Of Service Is: | Then Use: |
| :---: | :---: | :---: |
| numeric only $<10$ digits | numeric only | Mode 2 |
| alphanumeric $<7$ characters | numeric only | Mode 3 |
| other than above | numeric only | Mode 4 |
| any of the above | alphanumeric | Mode 4 |

### 13.2.4 Print Quality for MaxiCodes on Labels

The AIM International Technical Specification — International Symbology Specification — MaxiCode
SHALL be used to determine print quality of a MaxiCode symbol on a label. The minimum allowable grade SHALL be "C".

In order to accurately measure the quality of a printed MaxiCode symbol, the following guidelines
SHOULD be followed:

- Illumination of MaxiCodes on labels shall be uniform, that is, of equal intensity over the entire symbol.
- The wavelength of the light chosen should be consistent with the readers used for the intended application.
- Calibration of the verifier must be maintained by using a contrast calibration master.

Note: The grade shown above is the result of specific measurements made according to the AIM International Symbology Specification - MaxiCode quality definition for the following: 1) symbol decode, 2) symbol contrast, 3) symbol print growth, 4) symbol axial non-uniformity, 5) symbol local nonuniformity, and 6) symbol unused error correction.

### 13.2.5 Quiet Zone

For the Carrier Sortation and Tracking application, this guideline recommends that the MaxiCode symbol have a quiet zone of $0.04 \mathrm{inch}(1 \mathrm{~mm})$ above, below, to the left, and to the right of the symbol. The quiet zone is included in the calculation of the size of the symbol.

### 13.2.6 Orientation and Placement

### 13.2.6.1 Orientation

Due to the nature of the MaxiCode symbology, specific symbol orientation is not required, as long as the requirement for the quiet zones are met.

## Trading Partner Labels Using Linear and 2D Symbols

### 13.2.6.2 Symbol Placement

As used in this guideline, the MaxiCode symbol SHALL be placed in the carrier segment. Refer to Figure 21.

Figure 21. Placement of MaxiCode Symbol on Label

NOTE: ILLUSTRATION IS NOT TO EXACT SIZE OR SCALE.

### 13.2.6.3 Label Placement

Labels SHALL be placed on unit loads and transport containers as specified in Section 13 of this guideline.

# Trading Partner Labels Using Linear and 2D Symbols 

### 14.0 EXAMPLES

This section provides graphic representations of label constructions referenced in this guideline.
NOTE: The illustrations in this section are NOT to size or scale.

## APPENDIX A. BAR CODE BLOCKS: ANSI MH10.8.2 DATA IDENTIFIERS, DATA LENGTHS, AND SHORT TITLES

ANSI FACT-1, was published by the American National Standards Institute (ANSI) in December 1991. It has since been revised as ANSI MH10.8.2. AIAG endorses the use of these Data Identifiers.

ANSI MH10.8.2 has more than 100 data identifiers defined for many purposes in many industries. The ANSI standard can be purchased by contacting the American National Standards Institute (ANSI) and requesting ANSI MH10.8.2.

The following table includes some of the DIs in ANSI MH10.8.2 of interest to AIAG members. The Short Title text SHOULD be used in the bar code building block, as specified in Section 9.11.

In many cases the Short Title text has been split into two lines to ensure the best fit in the title area of the building block.

Table A1. ANSI Data Identifiers

| DI | SUGGESTED <br> Short <br> TITLE | RECOMMENDED <br> MAXIMUM DATA <br> LENGTH | DESCRIPTION |
| :---: | :--- | :---: | :--- |
| B | CONTAINER <br> TYPE (B) |  | Container Type |
| 1B | RETURNABLE <br> CONTAINER (1B) |  | Returnable Container ID number |
| 2B | GAS CYLINDER <br> \# (2B) |  | Gas Cylinder ID number |
| 3B |  | 10 | Motor Freight Transport Equipment <br> Identification assigned by the manufacturer in <br> conformance with International Standards <br> Organization (ISO) standards |
| 4B | SCACTIL (4B) | Standard Carrier Alpha Code Trailer <br> Identification Label |  |
| C | PART \# <br> CONT. (C) | Continuation of a customer's Part Number |  |
| D | DATE <br> YYMMDD (D) |  | Date, in the format YYMMDD, significance of <br> the date mutually agreed among all trading <br> partners |

| DI | $\begin{gathered} \text { SugGested } \\ \text { Short } \\ \text { Title } \end{gathered}$ | Recommended Maximum Data LENGTH | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1D | $\begin{array}{\|l} \text { DATE } \\ \text { DDMMYY (1D) } \end{array}$ |  | Date, in the format DDMMYY, significance of the date mutually agreed among all trading partners |
| 2D | DATE <br> MMDDYY (2D) |  | Date, in the format MMDDYY, significance of the date mutually agreed among all trading partners |
| 3D | $\begin{aligned} & \text { DATE } \\ & \text { YDDD (3D) } \end{aligned}$ |  | Date, in the format YDDD (Julian), significance of the date mutually agreed among all trading partners |
| 4D | $\begin{aligned} & \text { DATE } \\ & \text { YYDDD (4D) } \end{aligned}$ |  | Date, in the format YYDDD (Julian), significance of the date mutually agreed among all trading partners |
| 5D | $\begin{aligned} & \text { DATE } \\ & \text { YYMMDDQQ (5D)) } \end{aligned}$ |  | Date, in the ISO format YYMMDD immediately followed by an ANSI X12.3 Data Element Number 374 Qualifier (QQ) providing a code for type of date (e.g., ship date, manufacture date) |
| 6D | $\begin{aligned} & \text { DATE } \\ & \text { YYYYMMDDQQ (6D)) } \end{aligned}$ |  | Date, in the ISO format YYYYMMDD immediately followed by an ANSI X12.3 Data Element Number 374 Qualifier (QQ) providing a code for type of date (e.g., ship date, manufacture date) |
| 7 D | DATE <br> MMYY (7D)) |  | Date, in the format MMYY, significance of the date mutually agreed among all trading partners |
| 10D | DATE <br> YYWW (10D)) |  | Date, in the format YYWW where WW represents week of the year, as agreed between customer and supplier |
| 11D | $\begin{aligned} & \text { DATE } \\ & \text { YYYYWW (11D)) } \end{aligned}$ |  | Date, in the format YYYYWW where WW represents week of the year, as agreed between customer and supplier |
| 12D | DATE <br> YYYYMMDD (12D)) |  | Date, in the format YYYYMMDD, significance of the date mutually agreed among all trading partners |
| 1H | $\begin{aligned} & \text { EMPLOYEE } \\ & \text { ID }(1 \mathrm{H}) \\ & \hline \end{aligned}$ |  | Employee ID as assigned by the employer |
| 2H | SSN (2H) |  | U.S. Social Security Number |

## Trading Partner Labels Using Linear and 2D Symbols

| DI | SugGested Short Title | RECOMMENDED Maximum Data LENGTH | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 3H | NON-EMPLOYEE <br> ID (3H) |  | ID number for non-employee (e.g., a contract worker or vendor) |
| I | VIN |  | VIN - Vehicle Identification Number |
| 1J | $\begin{array}{\|l\|} \hline \text { ISO PKG } \\ \text { ID (1J) } \end{array}$ | 18 | Unique license plate number assigned to a transport unit that is the lowest level of packaging, or the unbreakable unit, as defined in ISO/IEC 15459 |
| 2 J | $\begin{array}{\|l} \text { ISO MASTER } \\ \text { ID (2J) } \end{array}$ | 18 | Unique license plate number assigned to a transport unit that contains multiple packages, as defined in ISO/IEC 15459.1 |
| K | P.O. \# (K) |  | Purchase Order Number, customer assigned |
| 2K |  |  | Bill of Lading/Waybill/Shipment Identification Code assigned by supplier/shipper |
| 3K |  |  | Bill of Lading/Waybill/Shipment Identification Code assigned by the carrier |
| 4K |  |  | Line number of the order assigned by the customer to identify a Purchasing Transaction |
| 5K |  |  | Reference number assigned by the customer to identify a Shipment Authorization (Release) against an established Purchase Order |
| 6K |  |  | PRO\# assigned by the carrier |
| 7K |  |  | Carrier Mode in Free Text format mutually defined between the customer and supplier (e.g., Air, Truck, Boat, Rail) |
| 8K |  |  | Contract Number |
| 9K |  |  | Generic Transaction Reference Code (internally assigned or mutually defined) |
| 11K |  |  | Packing List Number |
| 12K |  |  | SCAC (Standard Carrier Alpha Code) (Alpha Numeric, always four characters, dash "--" filled left) and carrier-assigned progressive number |
| 14K |  |  | Combined Order Number and Line Number in the format nn...nn+nn...n where a plus symbol $(+)$ is used as a delimiter between the Order Number and Line Number |

# Trading Partner Labels Using Linear and 2D Symbols 

| DI | SugGested Short Title | Recommended Maximum Data LENGTH | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 15K | PULL SIGNAL \# (15K) |  | Pull Signal - Kanban ID |
| 16K | $\begin{aligned} & \text { DELINS \# } \\ & (16 \mathrm{~K}) \end{aligned}$ |  | DELINS Number: code assigned to identify a document that contains delivery information |
| L | STORAGE <br> LOCATION (L) |  | Storage Location |
| 1L | LOCATION (1L) |  | Location (generic) |
| 4L | COUNTRY OF ORIGIN (4L) |  | Country of Origin: two-character code from the ISO 3166 standard country code list |
| 20L-24L |  |  | Additional location numbers. The exact meaning of each DI is assigned internally. <br> \{This set of DIs could be used for a hierarchy of locations, for example: <br> BUILDING (20L); BAY (21L); AISLE (22L); SHELF (23L); BIN (24L) \} |
| P | PART \# CUST (P) |  | Part Number, assigned by the customer |
| 1 P | PART \# <br> SPLR (1P) |  | Part Number, assigned by the supplier/manufacturer |
| 2 P | EC \# (2P) |  | Code assigned to specify the revision level of the part (e.g., Engineering Change Level, revision, or edition) |
| 9 P |  |  | Combined manufacturer identification code (9digit DUNS ${ }^{\circledR}$ number assigned by Dun \& Bradstreet) and the item code/part number (assigned by the manufacturer) |
| 10P |  |  | Hazardous Material Code as defined by ANSI X12.3 in the format Data Element 208 (1character code qualifier) followed by Data Element 209 (Hazardous Material Code) |
| Q | QUANTITY (Q) |  | Quantity (integer numeric) (Unit of measure assumed to be "each" unless otherwise agreed between the supplier and the customer) |
| 1Q | LENGTH (1Q) <br> or <br> THEORETICAL <br> WEIGHT (1Q) |  | Actual Length or Theoretical Weight (historically used in the shipment of primary metals) |

## Trading Partner Labels Using Linear and 2D Symbols

| DI | SugGested Short Title | RECOMMENDED Maximum Data LENGTH | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 2Q | ACTUAL <br> WEIGHT (2O) |  | Actual Weight |
| 3Q | UNIT OF MEASURE (3Q) |  | Unit of Measure, as defined by the two character ANSI X12.3 Data Element Number 355 Unit of Measurement Code |
| 7 Q | $\begin{aligned} & \mathrm{QTY}+\mathrm{U} / \mathrm{M} \\ & (7 \mathrm{Q}) \end{aligned}$ |  | Quantity and unit of measure in the format: Quantity followed by the two-character Unit of Measure code as defined in Data Element number 355 of the ANS X12.3 Data Element Dictionary standard |
| 11Q | $\begin{aligned} & \text { TARE WT. } \\ & (11 \mathrm{Q}) \end{aligned}$ |  | Tare Weight: weight of an empty container, unit of measure mutually agreed among trading partners |
| S | SERIAL \# (S) |  | Serial Number assigned by the supplier to an entity for its lifetime |
| 2 S | SHIPMENT ID (2S) |  | Shipment ID number. If you are using EDI, this corresponds to the SID (Data Element 396 of ANS X12.3, as used in the 856 Shipment Notification transaction). |
| 3 S | $\begin{aligned} & \text { PKG ID-UNIT } \\ & (3 \mathrm{~S}) \end{aligned}$ | 9 | Package Identification assigned by the supplier to the lowest level of packaging (container) that has a package ID code. |
| 4 S | $\begin{aligned} & \text { PKG ID-MASTER } \\ & \text { (4S) } \end{aligned}$ | 9 | Package Identification assigned by the supplier to packaging containing multiple containers of like items on a single customer order (Master Load) |
| 5S | $\begin{aligned} & \text { PKG ID-MIXED } \\ & (5 \mathrm{~S}) \end{aligned}$ | 9 | Package Identification assigned by the supplier to packaging containing multiple containers of unlike items on a single customer order (Mixed Load) |
| 9 S | PKG ID MUTUAL (9S) |  | Generic Package Identification, significance mutually agreed by customer and supplier |
| 10S | $\begin{aligned} & \text { MACHINE ID } \\ & (10 \mathrm{~S}) \end{aligned}$ |  | Machine, work cell, or tool ID code |
| 11S | $\begin{aligned} & \text { FIXED ASSET } \\ & \text { ID (11S) } \\ & \hline \end{aligned}$ |  | Fixed asset ID code |

| 1 Z |  |  | Mutually defined between the carrier and the supplier (title to reflect mutually agreed meaning) |
| 2 Z |  |  | Mutually defined between the customer and the carrier (title to reflect mutually agreed meaning) |
| 4 Z |  |  | Mutually defined between the carrier and the trading partner (title to reflect mutually agreed meaning) |

# Trading Partner Labels <br> Using Linear and 2D Symbols 

## APPENDIX B. PRECISION AND ROUNDING IN MEASUREMENT

| PRECISION \& ROUNDING RULE | INTERPRETATION |
| :--- | :--- |
| When determining if a measurement falls within the <br> specifications of this AIAG document, the <br> measurement SHALL be used only at the level of <br> precision stated in the document. | PRECISION is the degree of exactness with which <br> a quantity is stated. That is, it is the number of <br> significant digits (usually decimal places). |
| ROUNDING is the process used to reduce the |  |
| precision with which a number is stated (that is, |  |
| decrease the number of decimal places). Rounding |  |
| is done in order to compare two numbers at the |  |
| same level of precision. |  |

# Trading Partner Labels Using Linear and 2D Symbols 

## PRECISION \& ROUNDING RULE

The rule used for rounding SHALL be: add 5 to the digit to the immediate RIGHT of the level of precision required, then drop (truncate) the extra digits -- those beyond the required level of precision.

## INTERPRETATION

As an example:
Assume that document states that a dimension is 0.6 inches. Then the required precision is one decimal place.

If the measurement device used shows it to be 0.6465 inches, is that measurement "in spec"?

Since one (1) digit of decimal precision is stated in the AIAG document, the measurement SHALL be rounded to a single decimal place before comparing it to the standard, as follows:

1. Add 0.05 ( 2 digits) to the measurement:
$(0.6465+0.05=0.6965)$
2. Drop the digits past (to the right of) the decimal required:
0.6965 yields 0.6 , which IS within specifications.

Note that the measurement (0.6465) would be "out of spec" if the standard specification had stated 0.64 , since rounding to two decimal places would have given $0.65(0.6465+0.005=0.6515 \gg 0.65)$.

As another example, assume the instrument used can measure to a certain number of decimal places of precision:

Table B1. Rounding and Acceptable Measurements

| THIS <br> DOCUMENT <br> STATES | ROUNDING <br> FACTOR |  | ACCEPTABLE MEASUREMENTS ON A.... <br>  <br> READING |  |  | 3-DIGIT <br> READING | 4-DIGIT READING |
| :--- | :--- | :--- | :--- | :--- | :---: | :---: | :---: |
|  | 0.5 | 0.50 to 1.49 | 0.500 to 1.499 | 0.5000 to 1.4999 |  |  |  |
| 1.0 | 0.05 | 0.95 to 1.04 | 0.950 to 1.049 | 0.9500 to 1.0499 |  |  |  |
| 1.00 | 0.005 | 1.00 only | 0.995 to 1.004 | 0.9950 to 1.0049 |  |  |  |
| 1.000 | 0.0005 | cannot be used | 1.000 only | 0.9950 to 1.0040 |  |  |  |

# Trading Partner Labels Using Linear and 2D Symbols 

## APPENDIX D. RECOMMENDED ORDER OF DATA

The following list is a recommended order of typical data contained within a label as outlined within this document. It is recommended that trading partners recognize that some data may be common between segments and SHOULD, where practical, try not to duplicate data -for example: quantity (Q) could appear in both the customer segment and the supplier segment where both use the same definition of unit of measure.

- Address - Ship-From / Ship-To / For (delivery location / line feed location)
- Sequence Number / Broadcast Code (customer-assigned)
- Purchase Order Number (customer-assigned)
- Part Number (P) / Safety Indicator / Part Description / Engineering Change Level (customerassigned)
- Quantity (Q) (if the customer's unit of measure is different from the supplier's)
- Supplier's Identification (customer-assigned)
- Package ID / Label Serial Number / Unique Container Identification (supplier-assigned)
- Part Number (1P) / Description (supplier-assigned)
- Quantity with ANSI Unit of Measure (7Q) (supplier-assigned)
- Actual Quantity (2Q) (supplier-assigned)
- Theoretical Quantity (1Q) (supplier-assigned)
- Quantity (Q) (if the customer's unit of measure is the same as the supplier's)
- Returnable Container ID Code
- Date of Manufacture
- Quality Checker ID
- Country of Origin
- Part Traceability Data: Lot Number / Heat Number / Individual Part Serial Number
- Work Order Number

# Trading Partner Labels Using Linear and 2D Symbols 

## APPENDIX E. RECOMMENDED FORMAT FOR COMPLIANCE SPECIFICATIONS

| COMPLIANCE SPECIFICATION RULE | INTERPRETATION |
| :--- | :--- |
| Customer trading partners who require their <br> suppliers to provide labels in compliance with this <br> guideline SHOULD use the following format to <br> document their label compliance specification. | The single-page documentation format described in <br> this appendix was designed by the AIAG Bar Code <br> Applications Work Group to provide a commonized <br> approach to creating documentation for customer <br> labeling standards. This format has been shown to <br> support the documentation requirements of QS- <br> 9000 and ISO 9000. |
| Each type of label required by a customer |  |
| SHOULD be documented on a single page. | The commonized approach requires that every <br> customer provide a single page specification for <br> each specific layout of a label that will be required <br> by that customer. For example, if the customer <br> requires a single-container label, a master label, and <br> a mixed load label, the customer's compliance <br> specification would have three pages in it, showing <br> the requirements for those three layouts. |
| Supplier trading partners SHOULD keep a file of <br> the customer compliance specifications for their <br> customers. | The commonized approach to Trading Partner Label <br> specifications requires that every supplier who must <br> comply with a customer compliance specification <br> create a "Label Compliance" three-ring binder. The <br> first thing in the binder should be a copy of this <br> standard. Following that should be a divider for <br> each customer to whom that supplier ships. In the <br> section for any one customer should be the <br> information about that customer's label <br> specification(s). |

## Trading Partner Labels Using Linear and 2D Symbols

Appendix E Figure 1. An Example of a Blank Customer Compliance Specification Sheet

## COMPLIANCE SPECIFICATION RULE

The compliance specification sheet SHOULD show a sample of the label layout required by the customer.

A note SHOULD appear somewhere on the sheet that says "Not to Scale."

A title block SHOULD appear on the bottom of the compliance specification sheet.

## INTERPRETATION

In the center of the suggested specification page should be an example of the label, printed according to the layout designed by the customer.

The example will probably need to be scaled down to about $60 \%$ to $80 \%$ of the planned size.

The title block provides the information needed to properly track customer compliance specifications as required by ISO 9000 and QS-9000.

## COMPLIANCE SPECIFICATION RULE INTERPRETATION

The title block SHOULD include:

1. The name of the customer (and, if necessary, the facility) for which this format is required;
2. Contact information of the person (or department) at the customer's location responsible for this label;
3. The date on which the specification was issued, and its revision level;
4. The situation in which this format is to be used (for example, container vs. pallet label);
5. A note that says that all the rules not specified on this page are to be found in this guideline.
"Balloons" around the edges of the label example SHOULD contain descriptions of the exact data needed inside each sub-block.

The description balloon provided for a bar code sub-block SHOULD include:

1. A name that can be used when referring to this sub-block;
2. The title to be printed in this block;
3. The data that should go in the bar code;
4. The Data Identifier to be used as the prefix of the data in the bar code;
5. The maximum number of characters allowed in this field (data length and Data Identifier length).

See the example of a bar code block balloon.

# Trading Partner Labels Using Linear and 2D Symbols 

## COMPLIANCE SPECIFICATION RULE INTERPRETATION

The description balloon provided for a text subblock SHOULD include:

1. A name that can be used when referring to this sub-block;
2. The title to be printed in this block;
3. The data that should be printed in the text;
4. The maximum number of characters allowed in this field;
5. The text height required (stated in Lines Per Block).

See the example of a text block balloon in the Example, below.

If no title is to be printed for this text block, indicate "none."

If the text is to be printed on multiple lines (such as an address), indicate the number of lines and the maximum number of characters per line.

## Trading Partner Labels Using Linear and 2D Symbols

Appendix E Figure 2. Example of a Description Balloon for a Text Sub-block

# Trading Partner Labels Using Linear and 2D Symbols 

Appendix E Figure 3. Example of a Description Balloon for a Bar Code Sub-block

| COMPLIANCE SPECIFICATION RULE | INTERPRETATION |
| :--- | :--- |
| The compliance specification sheet(s) SHOULD be <br> sent to suppliers with a cover letter explaining its <br> purpose and its relationship to the AIAG B-10 <br> document. | Copies of this copyrighted document can be <br> purchased by calling AIAG's Customer Service <br> Representatives at (248) 358-3003. |
| At a minimum the cover letter SHOULD state: |  |
| 1. The name and phone number of a contact at the |  |
| customer company who could answer |  |
| questions; |  |
| 2. The due date for the supplier to reply indicating |  |
| their intended date of compliance; |  |
| 3. The due date for submission of a sample label |  |
| for evaluation; |  |

## COMPLIANCE SPECIFICATION RULE $\quad$ INTERPRETATION

4. The due date for the start of labeling;
5. A requirement that this specification be kept in a file or binder along with a copy of the AIAG $\mathrm{B}-10$ guideline, accessible to the people applying the labels, the people quality-checking the labels, and the people supporting the system that produces the labels;
6. Information about how the supplier can purchase a copy of this TPL Guideline.

# Trading Partner Labels Using Linear and 2D Symbols 

## APPENDIX F. RECOMMENDED FORMAT FOR SMALL LABELING AREA (SLA)

Designers of label segments are urged to plan no more than four building blocks per label segment, normally resulting in a label segment size of four inch by six inch or smaller, which generally fit in a label area of 36 square inches. This section describes a variation from the rules of ANSI MH10.8, which could be used when the area on a container available for a label is less than 36 square inches.

| SLA LABEL RULE |
| :--- |
| What is a Small Labeling Area (SLA)? |

What is a Small Labeling Area (SLA)?

A Small Labeling Area (SLA) label shall not be used for labeling surfaces greater than thirty-six (36) square inches. Also, the SLA label shall not be used when an area greater than thirty-six square inches is available for labeling. Trading partners should agree on the use of the SLA Label.

The heights and widths of bar-coded shipping labels being used today are often larger than the packaging. Packaging often requires a container larger than necessary to make the bar coded shipping label fit the container. Often, users wrap labels around the edges of containers to make labels fit. These conditions can drive up costs and can affect the scan performance of bar code symbols.

This appendix does not attempt to define how small is small but to offer a method for labeling containers having labeling surfaces of thirty-six (36) square inches or less.

The following describes requirements for developing a Small Labeling Area (SLA) label to ensure scan performance of the bar code symbols while providing consistency of label formats.

The SLA label was developed to more closely match label size to the container and to provide a more cost-effective labeling method.

Label applications for small containers such as those transported by commercial package carriers will benefit from using the SLA label.

The information contained in this appendix is not intended to replace any existing commercial

# Trading Partner Labels Using Linear and 2D Symbols 

| SLA LABEL RULE | INTERPRETATION |
| :---: | :---: |
|  | package carrier labeling used for sortation and tracking. <br> Both label and tag marking methods are covered under the general term label. <br> If you are including the carrier information in the SLA label you should check with your carrier for their bar code specifications. <br> This appendix recommends that the SLA label be structured based on this documents' Label Concepts. Due to the SCA label's smaller physical size, the major differences between the SLA label and the "normal" labels are noted below. |
| Building Block Size |  |
| Building block height SHALL be 0.5 inch $+/-0.1$ inch ( $13 \mathrm{~mm}+/-3 \mathrm{~mm}$ ) as determined by the printing capability of the labeler. |  |
| One double-height bar code block per segment may be used to satisfy special printing and scanning requirements of symbols used on SCLs. Doubleheight bar code blocks SHALL be 1.0 inch $+/-0.2$ inch ( $25 \mathrm{~mm}+/-5 \mathrm{~mm}$ ). |  |
| Bar Code Symbol Height |  |
| The minimum height of the Code 39 bar code symbol SHALL be 0.25 inch ( 6 mm ). |  |
| Bar Code Symbol Quiet Zone |  |
| The bar code symbol SHALL have leading and trailing quiet zones with minimum widths of 0.250 inch ( 6 mm ). |  |

## Trading Partner Labels Using Linear and 2D Symbols

| SLA LABEL RULE | INTERPRETATION |
| :--- | :--- |
| Symbology Narrow Element X |  |
| Dimension |  |

The narrow element X dimension when using Code 39 or Code 128 SHALL NOT be less than 0.010 inch ( 0.25 mm ).

## Human Readable Interpretation (HRI)

 for Code 39 or Code 128 SymbolsThe height of the HRI SHOULD be chosen so that it does not interfere with the minimum height of the bar code.

Print Quality for Code 39
The ANSI X3.182 Guideline for Bar Code Print Quality SHALL be used to determine the print quality of Code 39 and Code 128 symbols.

# Trading Partner Labels Using Linear and 2D Symbols 

## APPENDIX H. USER GUIDANCE WHEN PRINTING ANSI COMPLIANT PDF417 SYMBOLS

Several factors must be considered when printing PDF417 symbols on a Trading Partner Label. These considerations include:

- Data requirements
- Label area limitations
- Printer capabilities
- Scanner capabilities

All of these factors must be used to determine which values to use for PDF417 options, including:

- Number of data columns
- Narrow element dimension

Appendix H Figure 1. Structure of PDF417

PDF417-The Structure

Note: This guideline recommends that no more than 12 columns be used

# Trading Partner Labels Using Linear and 2D Symbols 

Developers and users of 2D printing software should use the following guidelines when determining which values to use for PDF417 options. Since there are many design decisions and potential solutions when configuring PDF417 symbols, Tables H1 through H7 have been included to aid in that selection. These guidelines will help ensure that valid symbols are printed. In addition, they will help ensure that a user's scanning and printing requirements have been considered.

## Part I - Designing The Label Layout

The following steps will help the label designer to plan the size of block that should be set aside for the PDF417 symbol on a label.

## 1. Plan for the maximum amount of data

- Determine which data fields that you will require in the message, and the maximum anticipated length of each field.
- Add in the additional characters needed for formatting, such as Data Element Separators, Format Headers, etc.
- Plan for a data size equal to, or greater than the sum of all the data fields plus the additional characters.

## 2. Plan for scanning equipment capabilities

The symbol width may be constrained by the label width or the capabilities of the scanning equipment you are planning to use. It is also important to consider the capabilities of the scanning equipment you are planning to use when choosing a block or sub-block size in which to encode a PDF417 symbol.

For example, if your equipment has a maximum field width of 3 inches, it would be impossible to read a symbol in a single-height block that is 4 inches wide, but the same data in a double-height block could fit in a symbol that is only 2.6 inches wide

## 3. Plan for the maximum " $X$ " dimension that may be used

" X " dimension is another name for narrow element width. Since the supplier/printer of the label ultimately determines the " $X$ " dimension at which the symbol will be printed (see Section 17), it is possible that a PDF417 symbol printed for a Shipping/Receiving application could be printed at any "X" dimension from 0.010 to 0.017 inch ( 0.25 to 0.43 mm ). The label designer should plan for the largest " X " dimension that might be used in printing.

## 4. Find the appropriate size in the tables

Table H1 gives approximate width of symbols for single-height and double-height blocks containing a PDF417 symbol up to the stated number of alphanumeric characters, using " $X$ " dimensions 0.017 inch $(0.43 \mathrm{~mm}), 0.015$ inch $(0.38 \mathrm{~mm}), 0.013$ inch $(0.33 \mathrm{~mm})$, and 0.10 inch $(0.25 \mathrm{~mm})$. . The sizes are an approximation; actual sizes may vary based on factors including the compaction algorithm and the nature of the data to be encoded.

In Table H1:

## Trading Partner Labels Using Linear and 2D Symbols

- Find the maximum number of characters (from step 1) you anticipate will be used for your application
- Find the maximum " $X$ " dimension you anticipate will be used for your application (from step 3)
- Look under the Single-Height or Double-Height column to find symbol width.

If the space available on your label width or the capabilities of the scanning equipment you are planning to use does not accommodate the symbol size, one option is to consider reducing the character count; another might be to gain trading partner agreement to reduce the " X " dimension.

Table H1: Symbol Width and Character Count for PDF417 Symbols

| "X" | $\begin{aligned} & 0.017 \mathrm{inch} \\ & (0.43 \mathrm{~mm}) \\ & \hline \end{aligned}$ |  | $\begin{array}{\|l\|} \hline 0.015 \mathrm{inch} \\ (0.38 \mathrm{~mm}) \end{array}$ |  | $\begin{array}{\|l} \hline 0.013 \mathrm{inch} \\ (0.33 \mathrm{~mm}) \\ \hline \end{array}$ |  | $\begin{aligned} & \hline 0.010 \mathrm{inch} \\ & (0.25 \mathrm{~mm}) \\ & \hline \end{aligned}$ |  |

Assumptions:

Symbol Width Includes Quiet Zones

Single-Height Block Assumed to be 0.8 inch (20.32 mm).

Double-Height Block Assumed to be 1.6 inch (40.64mm).

# Trading Partner Labels Using Linear and 2D Symbols 

## Part II - Printing The Symbol On The Label

This guideline recommends that PDF417 symbols for the Shipping and Receiving application be printed with no more than 12 Data Columns, unless mutually agreed upon by all trading partners involved. This limitation, combined with the amount of space allocated for the symbol on the label, may influence the choice of " X " dimension for printing the symbol. The capability of your printing equipment will determine your possible choices of " X " dimension.

Tables H2 through H7 illustrate the number of alphanumeric characters and the number of Data Columns that can be encoded in single-height and double-height blocks. Each table illustrates a different "X" dimensions. Tables H2 through H5 describe symbol widths for labels up to 4.0 inches ( 102 mm ) wide. Tables H6 and H7 describe symbol widths for labels above 4 inches wide.

- The tables were calculated using the following assumptions:
- Symbol width includes quiet zones of 0.04 inch on all sides.
- Single-height block is assumed to be 1.0 inch ( 25.4 mm ).
- Double-height block is assumed to be 2.0 inches ( 50.8 mm ).
- Bar height is assumed to be 3 " X " ( 3 times the " X " dimension).

Table H2: Sizes and Character counts up to Four Inches with $\mathbf{. 0 1 0}$ inch " X " Dimension

# Trading Partner Labels Using Linear and 2D Symbols 

## APPENDIXI-SCANNING GUIDANCE

## Scanning issues that are valid for all types of scanners and all symbologies:

- Keep the reader-to-symbol distance within the range recommended by the manufacturer.
- When using a handheld reader, be sure to hold the reader within the allowable angles. Pitch, yaw and skew are used to describe the angles of the reader to the symbol.
- In an omnidirectional reader, yaw (rotation) does not matter. Pitch causes the top and bottom of the symbol to be at different distances from the reader and skew causes the left and right sides of the symbol to be at different distances.
- Be sure to select a reader that is best for the normal lighting of the application. Readers are designed to work over a wide range of lighting conditions, but some may work better in sunlight while others work better in darker conditions.
- Although readers are generally motion tolerant, handheld CCD readers achieve best results when held steady while reading.
- Be sure the reader is capable of reading at the speed of the system, and if necessary, have the reader tuned by the manufacturer for the expected speed. Fixed-position readers often require the label to be in motion. There may be upper or lower limits to the allowable velocity of the label.
- The area in which the symbol can be seen (field of view) is defined. The symbol must be within the field of view when the reader is triggered.

## Scanning issues Specific to Reading MaxiCode:

MaxiCode is intended to be read by omni-directional fixed-position or omnidirectional handheld readers. Care should be taken to use a reader that has the appropriate firmware installed to make MaxiCode reading possible.

The following guidance is provided for the types of readers available for reading MaxiCode:

- Omnidirectional fixed-position CCD: Two types of fixed-position CCD readers, 2D and linear, are commonly available for reading MaxiCode.
- 2D CCD readers are typically used for low throughput applications. The label's image must be brought to a virtual stop (possibly with a strobe or shutter) to take a blur-free image.
- Linear CCD readers are typically used for higher volume applications or where a larger field of view is required. The label is transported past the reader and the image is built up line by line.
- Omnidirectional handheld CCD: An omnidirectional handheld CCD reader takes a digital snapshot of the MaxiCode symbol. The digital image thus formed is processed by the onboard computer to extract the bit values from each of the cells.
- As with any reader, take care to hold the omnidirectional handheld CCD readers steady when taking the picture.

# Trading Partner Labels Using Linear and 2D Symbols 

## Scanning issues Specific to Reading PDF417:

PDF417 is specifically designed to be read by a range of products based on Laser and CCD technology, both in handheld and fixed-position devices, as well as integrated with handheld portable computers. Laser technology provides very high performance (speed), a large depth of field, and a wide field of view. It is generally immune to environmental considerations such as ambient light.

The following types of readers are available for reading PDF417:

- Raster Laser: A raster laser device scans the 2D symbol horizontally and vertically at high speed, permitting "aim and shoot" operation in a handheld device. The raster laser pattern must be aligned with the rows in the PDF417 symbol. The raster laser generally provides full backward compatibility with linear bar codes (Code 39/Code 128) used today. A Raster Laser may be used in a fixed-position along a moving assembly line or conveyor while the label is moved through the scanner's field of view.
- Linear Laser: A linear laser beam must be moved across the PDF417 symbol ("painted") to collect (row by row) all codeword elements to accomplish a complete symbol decode. One example of an application for a linear laser is with a continuously "on" fixed-position scanner reading a label attached to an object moving along an assembly line.
- Linear CCD: A linear CCD reader in a handheld device may be moved across the PDF417 symbol ("painted") to collect (row by row) all of the codeword elements. The device needs to be aligned with the rows in the PDF417 symbol. A linear CCD reader also captures an image of a PDF417 symbol if passed under the field of view of the CCD at a fixed speed (overhead scanner mounted above a conveyor).
- 2D CCD Reader: PDF417 may be imaged (entire picture captured at one time) using 2D CCD array technology in a handheld or a fixed-position reader. The benefit of a 2D reader is that it provides omnidirectional capability.

# Trading Partner Labels Using Linear and 2D Symbols 

## APPENDIX J - ENCODING DUPLICATE DIS IN A SINGLE MESSAGE

## Encoding Multiple Occurrences Of The Same Data Identifier (DI) In A Single Message

This section provides a guideline for using two methods of encoding multiple occurrences of the same Data Identifier (DI) in a single two-dimensional (2D) symbol message:

- "Nesting", as outlined under this Guideline.
- "Looping", as outlined under in Section VI of ANSI MH10.8.2 1995 DSTU (R2002) Data Identifier and Application Identifier Standard.

Both encoding structures use the same formats for the Message Header, Data Element Separator and Message Trailer:

- Message Header: [ $>^{\mathrm{R}}$ s
- [)> is the Compliance Indicator
- Counted as 3 characters
- $\quad \mathrm{R}_{\mathrm{S}}=$ Format Separator
- Counted as a single character
- Data Element Separator $=\mathbf{G}_{\mathbf{s}}$
- $\quad$ Counted as a single character
- Message Trailer: ${ }^{R}{ }_{S}{ }^{E} \mathbf{O}_{\mathbf{T}}$
- $\quad \mathrm{R}_{\mathrm{S}}=$ Format Separator
- Counted as a single character
- $\quad{ }^{\mathbf{E}} \mathbf{O}_{\mathbf{T}}=$ End of Transaction
- Counted as a single character

When using the "Nesting" method, multiple instances of the same data type are encoded in separate Format Envelopes within the Message Envelope.

The figure below illustrates the "Nesting" data format of a Mixed Load Pallet with various part numbers, containers types and serial numbers to be delivered to several locations:

## Trading Partner Labels Using Linear and 2D Symbols

## Appendix J Figure 1. Example of Mixed Load "Nesting"

In this example, each Format Envelope inside the Message Envelope requires the use of both a Format

Header and a Format Trailer. The complete message encodes 274 characters of data.
The table below provides an explanation of the data stream in the example above.

## Trading Partner Labels Using Linear and 2D Symbols

| Format Trailer |  | $\mathrm{R}_{\mathrm{S}}$ |
| Message Trailer |  | ${ }^{\text {E }} \mathrm{O}_{\text {T }}$ |

## Trading Partner Labels Using Linear and 2D Symbols

Below is the complete data stream:

$196 G_{s} B C A R T O N R_{s} 06 G_{s} 3 S 1237$ G $_{s} P 12245678 G_{s}$ Q100 ${ }_{s} 20 L A 3-$
$190 G_{s} B K L T 1424 R_{s} 06 G_{s} 3 S 1235 G_{s} P 12045678^{G_{s} Q 100} G_{s} 20 L A 6-$
$193 G_{S} B K L T 1424 R_{S} 06 G_{S} 3 S 1228 G_{S} P 12005678 G_{S} Q 1000{ }_{S} 20 L B 3-196 G_{S} B C A R T O N R_{S} E_{T}$
However, using the data from the example above, "Looping" can encode the same message in 240 characters of data, saving 34 characters.

See next page.

## Trading Partner Labels Using Linear and 2D Symbols

The ANSI MH10.8.2 "Looping" structure, following the Hierarchical Level (HL) structure of the ASC X12 EDI 856 Ship Notice / Manifest, uses the Data Identifier " $F$ ", as illustrated in the example below.

In this particular example, the containers on the Mixed Load are sorted according to delivery location. The Hierarchical structure will accommodate almost any sortation approach.

Appendix J Figure 3. Looping Structure for a Mixed Load encoding 240 Characters

The structure of the "Header" information for the "Looping" hierarchy is as follows:

- Hierarchical ID Number: 2 alphanumeric characters (always, or up-to?)
- Answers the question, "Who am I?"
- Parent ID Number: 2 alphanumeric characters Answers the question, "Who is my Parent?"
- Child Code: $0=\mathrm{No} ; 1=$ Yes
- Answers the question, "Do I have a child?"
- Hierarchical Level Code: 1 or 2 characters. From Data Element 735 of the ASC X12 Data Element Dictionary
Answers the question, "What am I?"

## Trading Partner Labels Using Linear and 2D Symbols

The following examples describe the interpretation of the first two format headers.

| F01001S | Fis the DI for "Looping" <br> answers the question, "Who am I?" I am the highest level of <br> this Hierarchy. |
| :--- | :--- |
| F02011B | $\mathbf{0 0}$ |
| answers the question, "Who is my Parent?" Since this is the |  |
| highest level of the Hierarchy, there is no parent. |  |
| answers the question, "Do I have a child?" The number " 1 "" |  |
| means "Yes," there are subordinate segments. |  |

## Trading Partner Labels Using Linear and 2D Symbols

A Master Load has the potential of saving even more data when using the "Looping" structure.
Following is an example of "Nesting" data for a Master Load.

Appendix J Figure 4. Example of Master Load "Nesting" structure encoding 460 data characters.

In this example, the same Part Number, Quantity, Location and Container Type are repeated eight times, along with the Format Envelope Header and Trailer information, requiring 460 data characters to encode the message.

Using "Looping", the duplication is eliminated, thereby requiring only 203 data characters, saving 257 characters.

## Trading Partner Labels Using Linear and 2D Symbols

Appendix J Figure 5. "Looping" Structure Of Master Load Encoding 203 Characters Of Data.

# Trading Partner Labels Using Linear and 2D Symbols 

## ABOUT AIAG

## Purpose Statement

To provide an open forum where members cooperate in developing and promoting solutions that enhance the prosperity of the automotive industry. Our focus is to continuously improve business processes and practices involving trading partners throughout the supply chain.

## Core Values

- People - Our strength comes from passionate and personally committed volunteers and staff. We provide an environment of integrity, trust, teamwork, and mutual respect to foster open, frank communication as we achieve consensus on industry needs and solutions.
- Innovation - With a sense of urgency, we drive and support the development and implementation of common, leading-edge solutions that provide value to the automotive industry and its customers.
- Excellence - We provide quality and excellence in all we do and how we do it.

We do what's right for the industry!

## AIAG Organization

AIAG is made up of a board of directors, an executive director, associate directors, a full-time staff, and volunteers serving on project teams. Under the direction of the executive director, associate directorsalong with the managing director, department managers, and program managers, plan, direct, and coordinate the association's activities. The executive director and loaned executives are on loan from member companies for varied lengths of time.

## AIAG Projects

Volunteer committees focus on business processes or supporting technologies and methodologies. They conduct research and develop, publish, and provide training on standards, conventions, standard business practices, white papers, and guidelines in the areas of automatic identification, CAD/CAM, EDI/electronic commerce, continuous quality improvement, materials and project management, returnable containers and packaging systems, and transportation/customs.

[^0]:    Note: Previous AIAG Standards (B-3 and B-5) specified an inspection wavelength of 900 nanometers $+/-10 \%$ to accommodate existing infrared scanners. Scanners using visible light sources ( 630 to 680 nanometers) are preferred. Meeting the minimum bar code print quality requirements at the infrared wavelength generally ensures acceptable print quality levels at the visible light wavelength.
